# Quantum Gravity from AdS/CFT

## An ambitious question

The (semi)classical gravity we observe in our universe emerges from some more fundamental quantum theory - how?

# Quantum Gravity from AdS/CFT

## An ambitious question

The (semi)classical gravity we observe in our universe emerges from some more fundamental quantum theory - how?

- Hard to even begin to answer because we don't know what the full formulation of such a theory is!
- We need a framework in which to work: in context of string theory, AdS/CFT gives us a nonperturbative, indirect *definition* of a theory of quantum gravity

# Quantum Gravity from AdS/CFT

## AdS/CFT Correspondence [Maldacena]

A nonperturbative, background-independent theory of quantum gravity with asymptotically (locally) anti-de Sitter boundary conditions – the “bulk” – is dual to a conformal field theory – the “boundary” – living on (a representative of the conformal structure of) the asymptotic boundary of the bulk.

# Quantum Gravity from AdS/CFT

## AdS/CFT Correspondence [Maldacena]

A nonperturbative, background-independent theory of quantum gravity with asymptotically (locally) anti-de Sitter boundary conditions – the “bulk” – is dual to a conformal field theory – the “boundary” – living on (a representative of the conformal structure of) the asymptotic boundary of the bulk.

Work around a limit in which the bulk is well-approximated by a classical geometry:

# The Holographic Dictionary

Using AdS/CFT as a framework, we can refine the question:

A slightly less vague question

In AdS/CFT, when and how does (semi)classical gravity emerge from the boundary field theory?

# The Holographic Dictionary

Using AdS/CFT as a framework, we can refine the question:

A slightly less vague question

In AdS/CFT, when and how does (semi)classical gravity emerge from the boundary field theory?

- Requires understanding what “dual” means: the holographic dictionary

# The Holographic Dictionary

Using AdS/CFT as a framework, we can refine the question:

## A slightly less vague question

In AdS/CFT, when and how does (semi)classical gravity emerge from the boundary field theory?

- Requires understanding what “dual” means: the holographic dictionary
- Going from the bulk to the boundary is pretty well-understood (e.g. one-point functions of local boundary operators are given by the asymptotic behavior of local bulk fields)
- Going from the boundary to the bulk is harder: this is broadly termed “bulk reconstruction”

# A Line of Attack

The (semi)classical gravity we observe in our universe emerges from some more fundamental quantum theory - how?

⇓ (AdS/CFT)

In AdS/CFT, how do the CFT degrees of freedom rearrange themselves to look like a gravitational theory?

**How are operators on a *fixed* bulk geometry recovered?**

# Reconstruction of Bulk Operators

- In pure AdS, local field operators can be expressed in terms of local boundary operators by integrating against a kernel [Hamilton, Kabat, Lifschytz, Lowe]:

$$\phi(X) = \int_{D \subset \partial M} d^{d-1}x K(X|x) \mathcal{O}(x)$$

# Reconstruction of Bulk Operators

- In pure AdS, local field operators can be expressed in terms of local boundary operators by integrating against a kernel [Hamilton, Kabat, Lifschytz, Lowe]:

$$\phi(X) = \int_{D \subset \partial M} d^{d-1}x K(X|x) \mathcal{O}(x)$$

- Kernel may be taken to have support on different boundary regions  $D$

# Reconstruction of Bulk Operators

- In pure AdS, local field operators can be expressed in terms of local boundary operators by integrating against a kernel [Hamilton, Kabat, Lifschytz, Lowe]:

$$\phi(X) = \int_{D \subset \partial M} d^{d-1}x K(X|x) \mathcal{O}(x)$$

- Kernel may be taken to have support on different boundary regions  $D$

# Reconstruction of Bulk Operators

- In pure AdS, local field operators can be expressed in terms of local boundary operators by integrating against a kernel [Hamilton, Kabat, Lifschytz, Lowe]:

$$\phi(X) = \int_{D \subset \partial M} d^{d-1}x K(X|x) \mathcal{O}(x)$$

- Kernel may be taken to have support on different boundary regions  $D$
- Hints at subregion/subregion duality: a given boundary diamond  $D$  can reconstruct operators in some subregion of the bulk

# Reconstruction of Bulk Operators

- In pure AdS, local field operators can be expressed in terms of local boundary operators by integrating against a kernel [Hamilton, Kabat, Lifschytz, Lowe]:

$$\phi(X) = \int_{D \subset \partial M} d^{d-1}x K(X|x) \mathcal{O}(x)$$

- Kernel may be taken to have support on different boundary regions  $D$
- Hints at subregion/subregion duality: a given boundary diamond  $D$  can reconstruct operators in some subregion of the bulk
- Stronger hint comes from entanglement entropy

# Holographic Entanglement Entropy

## HRT Formula [Ryu, Takayanagi, Hubeny, Rangamani]

If  $\rho_R = \text{Tr}_{\bar{R}} \rho$  is the reduced state associated to some region  $R$  and the bulk is well-approximated by a classical geometry obeying Einstein gravity, then

$$S[R] \equiv -\text{Tr}(\rho_R \ln \rho_R) = \frac{\text{Area}[X_R]}{4G\hbar},$$

where  $X_R$  is the smallest-area codimension-two extremal surface anchored to  $\partial R$ .

# Holographic Entanglement Entropy

## HRT Formula [Ryu, Takayanagi, Hubeny, Rangamani]

If  $\rho_R = \text{Tr}_{\bar{R}} \rho$  is the reduced state associated to some region  $R$  and the bulk is well-approximated by a classical geometry obeying Einstein gravity, then

$$S[R] \equiv -\text{Tr}(\rho_R \ln \rho_R) = \frac{\text{Area}[X_R]}{4G\hbar},$$

where  $X_R$  is the smallest-area codimension-two extremal surface anchored to  $\partial R$ .

# Holographic Entanglement Entropy

- $X_R$  is generically spacelike separated from the causal diamond  $D[R]$ , so  $R$  is sensitive to more of the bulk than expected from just causal structure

# Holographic Entanglement Entropy

- $X_R$  is generically spacelike separated from the causal diamond  $D[R]$ , so  $R$  is sensitive to more of the bulk than expected from just causal structure
- Ideas from quantum error correction show that  $X_R$  defines the region of the bulk to which  $R$  is sensitive: bulk operators in the *entanglement wedge* defined by  $X_R$  can be represented by CFT operators in  $D[R]$   
[Dong, Harlow, Wall; Faulkner, Lewkowycz]

# Holographic Entanglement Entropy

- $X_R$  is generically spacelike separated from the causal diamond  $D[R]$ , so  $R$  is sensitive to more of the bulk than expected from just causal structure
- Ideas from quantum error correction show that  $X_R$  defines the region of the bulk to which  $R$  is sensitive: bulk operators in the *entanglement wedge* defined by  $X_R$  can be represented by CFT operators in  $D[R]$   
[Dong, Harlow, Wall; Faulkner, Lewkowycz]

[Dong, Harlow, Wall; Faulkner, Lewkowycz]
- What about recovering the bulk geometry itself and its properties?

# Moving Up

The (semi)classical gravity we observe in our universe emerges from some more fundamental quantum theory - how?

⇓ (AdS/CFT)

In AdS/CFT, how do the CFT degrees of freedom rearrange themselves to look like a gravitational theory?

⇓ (classical limit)

**When and how does (semi)classical gravity emerge from the boundary field theory?**

⇓ (probe limit)

How are operators on a *fixed* bulk geometry recovered?

# Recovering the Geometry

The HRT formula clearly connects bulk geometry to boundary entanglement, and its key role in recovering bulk operators on a fixed background strongly suggests it should play a role in recovering the geometry as well [Van Raamsdonk]. Does it?

# Recovering the Geometry

Some partial progress:

- Dynamics: For perturbations of vacuum, HRT implies the perturbative Einstein equations in the bulk [Lashkari, Faulkner, Guica, Hartman, McDermott, Myers, Van Raamsdonk, ...]

# Recovering the Geometry

Some partial progress:

- Dynamics: For perturbations of vacuum, HRT implies the perturbative Einstein equations in the bulk [Lashkari, Faulkner, Guica, Hartman, McDermott, Myers, Van Raamsdonk, ...]
- Gravitational thermodynamics: generic area laws in the bulk can be related to monotonicity properties of entropy
  - A coarse-grained entropy defined by fixing a portion of the bulk geometry gives area law along (spacelike) foliations of apparent horizons [Engelhardt, Wall]
  - Casini-Huerta  $c$ -theorem relates to mixed-signature area laws in bulk, including along early-time event horizons of black holes formed from collapse [Engelhardt, SF]

# Recovering the Geometry

Some partial progress:

- Dynamics: For perturbations of vacuum, HRT implies the perturbative Einstein equations in the bulk [Lashkari, Faulkner, Guica, Hartman, McDermott, Myers, Van Raamsdonk, ...]
- Gravitational thermodynamics: generic area laws in the bulk can be related to monotonicity properties of entropy
  - A coarse-grained entropy defined by fixing a portion of the bulk geometry gives area law along (spacelike) foliations of apparent horizons [Engelhardt, Wall]
  - Casini-Huerta  $c$ -theorem relates to mixed-signature area laws in bulk, including along early-time event horizons of black holes formed from collapse [Engelhardt, SF]
- Causal structure: instead of EE, can use the singularity structure of boundary correlators to deduce the causal structure of (part of) the causal wedge of the bulk [Engelhardt, Horowitz; Engelhardt, SF]

# Recovering the Geometry

Here, I'm interested in a more fine-grained question:

Does knowledge of the entanglement entropy of all regions (i.e. the areas of all HRT surfaces) determine the bulk geometry? How?

- Obviously EE can't recover the full geometry, since there can be regions that HRT surfaces don't reach
- The general expectation has been that EE can recover geometry wherever HRT surfaces reach, but never understood in detail

# A Geometric Problem

Assumptions:

- Dimension of bulk geometry  $M$  is  $d \geq 4$ , with *finite* boundary  $\partial M$
- A portion  $\mathcal{R}$  of  $M$  is foliated by a continuous  $(d - 2)$ -parameter family  $\{\Sigma(\lambda^i)\}$  of (planar) two-dimensional spacelike extremal surfaces anchored to  $\partial M$

# A Geometric Problem

Assumptions:

- Dimension of bulk geometry  $M$  is  $d \geq 4$ , with *finite* boundary  $\partial M$
- A portion  $\mathcal{R}$  of  $M$  is foliated by a continuous  $(d - 2)$ -parameter family  $\{\Sigma(\lambda^i)\}$  of (planar) two-dimensional spacelike extremal surfaces anchored to  $\partial M$

Claim: the geometry in  $\mathcal{R}$  is uniquely fixed by the metric and extrinsic curvature of  $\partial M$ , the curves  $\partial\Sigma(\lambda^i)$ , and the variations of the areas of the  $\Sigma(\lambda^i)$

# Overview of Argument

Four steps, inspired by [Alexakis, Balehowsky, Nachman], using inverse boundary value problems (same sort of techniques used in e.g. medical imaging or geophysics)

- 1 Gauge fix: introduce a unique coordinate system  $\{\lambda^i, x^\alpha\}$  in the region  $\mathcal{R}$ , with the  $x^\alpha$  conformally flat coordinates on  $\Sigma(\lambda^i)$ :

$$ds_\Sigma^2 = e^{2\phi}[(dx^1)^2 + (dx^2)^2]$$

# Overview of Argument

Four steps, inspired by [Alexakis, Balehowsky, Nachman], using inverse boundary value problems (same sort of techniques used in e.g. medical imaging or geophysics)

- 1 Gauge fix: introduce a unique coordinate system  $\{\lambda^i, x^\alpha\}$  in the region  $\mathcal{R}$ , with the  $x^\alpha$  conformally flat coordinates on  $\Sigma(\lambda^i)$ :  
$$ds_\Sigma^2 = e^{2\phi}[(dx^1)^2 + (dx^2)^2]$$
- 2 Showing that the  $g^{ij} \equiv g^{ab}(d\lambda^i)_a(d\lambda^j)_b$  are fixed reduces to an elliptic inverse boundary value problem on each  $\Sigma(\lambda^i)$

# Overview of Argument

Four steps, inspired by [Alexakis, Balehowsky, Nachman], using inverse boundary value problems (same sort of techniques used in e.g. medical imaging or geophysics)

- 1 Gauge fix: introduce a unique coordinate system  $\{\lambda^i, x^\alpha\}$  in the region  $\mathcal{R}$ , with the  $x^\alpha$  conformally flat coordinates on  $\Sigma(\lambda^i)$ :  

$$ds_\Sigma^2 = e^{2\phi} [(dx^1)^2 + (dx^2)^2]$$
- 2 Showing that the  $g^{ij} \equiv g^{ab}(d\lambda^i)_a(d\lambda^j)_b$  are fixed reduces to an elliptic inverse boundary value problem on each  $\Sigma(\lambda^i)$
- 3 By “tilting” each  $\Sigma(\lambda^i)$  to a nearby foliation, the  $g^{\alpha i} \equiv g^{ab}(dx^\alpha)_a(d\lambda^i)_b$  are obtained by solving a system of (algebraic) linear equations (with known coefficients)

# Overview of Argument

Four steps, inspired by [Alexakis, Balehowsky, Nachman], using inverse boundary value problems (same sort of techniques used in e.g. medical imaging or geophysics)

- 1 Gauge fix: introduce a unique coordinate system  $\{\lambda^i, x^\alpha\}$  in the region  $\mathcal{R}$ , with the  $x^\alpha$  conformally flat coordinates on  $\Sigma(\lambda^i)$ :  

$$ds_\Sigma^2 = e^{2\phi} [(dx^1)^2 + (dx^2)^2]$$
- 2 Showing that the  $g^{ij} \equiv g^{ab}(d\lambda^i)_a(d\lambda^j)_b$  are fixed reduces to an elliptic inverse boundary value problem on each  $\Sigma(\lambda^i)$
- 3 By “tilting” each  $\Sigma(\lambda^i)$  to a nearby foliation, the  $g^{\alpha i} \equiv g^{ab}(dx^\alpha)_a(d\lambda^i)_b$  are obtained by solving a system of (algebraic) linear equations (with known coefficients)
- 4 The requirement that the  $\Sigma(\lambda^i)$  all be extremal yields a hyperbolic evolution equation for  $\phi$ , which has a unique solution

# The Jacobi (or Stability) Operator

# The Jacobi (or Stability) Operator

# The Jacobi (or Stability) Operator

# The Jacobi (or Stability) Operator

If  $\Sigma(s)$  are all geodesics with tangent  $t^a$ , deviation vector  $\eta^a$  obeys the equation of geodesic deviation

$$0 = t^b \nabla_b (t^c \nabla_c \eta^a) + R_{bcd}{}^a t^b t^d \eta^c$$

# The Jacobi (or Stability) Operator

If  $\Sigma(s)$  are all extremal surfaces, deviation vector  $\eta^a$  obeys the Jacobi equation

$$0 = D^2 \eta^a + \underbrace{(K^{acd} K_{bcd} + P^{ac} \sigma^{de} R_{cdbe})}_{\text{curvature terms} \equiv Q^a_b} \eta^b \equiv J \eta^a$$

# The Jacobi (or Stability) Operator

- Second variations of the area of an extremal surface  $\Sigma$  under deformations of  $\partial\Sigma$  give information about its Jacobi operator
- Extend  $\Sigma$  to an arbitrary two-parameter family  $\Sigma(s_1, s_2)$  of extremal surfaces, with  $\Sigma(0, 0) = \Sigma$  and deviation vectors  $\eta_1^a = (\partial_{s_1})^a$ ,  $\eta_2^a = (\partial_{s_2})^a$

## The Jacobi (or Stability) Operator

- Second variations of the area of an extremal surface  $\Sigma$  under deformations of  $\partial\Sigma$  give information about its Jacobi operator
- Extend  $\Sigma$  to an arbitrary two-parameter family  $\Sigma(s_1, s_2)$  of extremal surfaces, with  $\Sigma(0, 0) = \Sigma$  and deviation vectors  $\eta_1^a = (\partial_{s_1})^a$ ,  $\eta_2^a = (\partial_{s_2})^a$
- The variation of the area  $A(s_1, s_2)$  is a boundary term:

$$\left. \frac{\partial^2 A}{\partial s_1 \partial s_2} \right|_{s_1=0=s_2} = \int_{\partial\Sigma} \eta_2^a D_N(\eta_1)_a + (\text{known boundary stuff})$$

## The Jacobi (or Stability) Operator

- Second variations of the area of an extremal surface  $\Sigma$  under deformations of  $\partial\Sigma$  give information about its Jacobi operator
- Extend  $\Sigma$  to an arbitrary two-parameter family  $\Sigma(s_1, s_2)$  of extremal surfaces, with  $\Sigma(0, 0) = \Sigma$  and deviation vectors  $\eta_1^a = (\partial_{s_1})^a$ ,  $\eta_2^a = (\partial_{s_2})^a$
- The variation of the area  $A(s_1, s_2)$  is a boundary term:

$$\left. \frac{\partial^2 A}{\partial s_1 \partial s_2} \right|_{s_1=0=s_2} = \int_{\partial\Sigma} \eta_2^a D_N(\eta_1)_a + (\text{known boundary stuff})$$

- So knowing how the area varies as the shape of  $\partial\Sigma$  is varied yields the Dirichlet-to-Neumann map of  $J$ :

$$\Psi : \eta^a|_{\partial\Sigma} \mapsto D_N \eta^a|_{\partial\Sigma} \text{ such that } J\eta^a = 0$$

## Elliptic Inverse Boundary Value Problems fix $g^{ij}$

- Inverse boundary value problem: if  $D_1^\dagger D_1 + Q_1$  and  $D_2^\dagger D_2 + Q_2$  acting on a vector bundle on a Riemann surface have the same Dirichlet-to-Neumann map, then  $D_1$ ,  $D_2$  and  $Q_1$ ,  $Q_2$  are the same (up to gauge) [Albin, Guillarmou, Tzou, Uhlmann]

## Elliptic Inverse Boundary Value Problems fix $g^{ij}$

- Inverse boundary value problem: if  $D_1^\dagger D_1 + Q_1$  and  $D_2^\dagger D_2 + Q_2$  acting on a vector bundle on a Riemann surface have the same Dirichlet-to-Neumann map, then  $D_1$ ,  $D_2$  and  $Q_1$ ,  $Q_2$  are the same (up to gauge) [Albin, Guillarmou, Tzou, Uhlmann]
- So Jacobi operator  $J$  of each  $\Sigma(\lambda^i)$  is determined by boundary data up to choice of basis on the normal bundle

## Elliptic Inverse Boundary Value Problems fix $g^{ij}$

- Inverse boundary value problem: if  $D_1^\dagger D_1 + Q_1$  and  $D_2^\dagger D_2 + Q_2$  acting on a vector bundle on a Riemann surface have the same Dirichlet-to-Neumann map, then  $D_1$ ,  $D_2$  and  $Q_1$ ,  $Q_2$  are the same (up to gauge) [Albin, Guillarmou, Tzou, Uhlmann]
- So Jacobi operator  $J$  of each  $\Sigma(\lambda^i)$  is determined by boundary data up to choice of basis on the normal bundle
- By construction, coordinate basis vector fields  $(\partial_{\lambda^i})^a$  are deviation vectors along a family of extremal surfaces, so  $J(\partial_{\lambda^i})^a = 0$
- Use this to fix the basis  $\{(n^i)_a\}$  on the normal bundle by requiring that  $(n^i)_a (\partial_{\lambda^j})^a = \delta^i_j$ , which fixes  $(n^i)_a = (d\lambda^i)_a$

## Elliptic Inverse Boundary Value Problems fix $g^{ij}$

- Inverse boundary value problem: if  $D_1^\dagger D_1 + Q_1$  and  $D_2^\dagger D_2 + Q_2$  acting on a vector bundle on a Riemann surface have the same Dirichlet-to-Neumann map, then  $D_1$ ,  $D_2$  and  $Q_1$ ,  $Q_2$  are the same (up to gauge) [Albin, Guillarmou, Tzou, Uhlmann]
- So Jacobi operator  $J$  of each  $\Sigma(\lambda^i)$  is determined by boundary data up to choice of basis on the normal bundle
- By construction, coordinate basis vector fields  $(\partial_{\lambda^i})^a$  are deviation vectors along a family of extremal surfaces, so  $J(\partial_{\lambda^i})^a = 0$
- Use this to fix the basis  $\{(n^i)_a\}$  on the normal bundle by requiring that  $(n^i)_a (\partial_{\lambda^j})^a = \delta^i_j$ , which fixes  $(n^i)_a = (d\lambda^i)_a$
- Metric-compatibility of connection in this gauge requires  $D_a g^{ij} = 0$ , which fixes  $g^{ij}$

## Tilting Fixes $g^{\alpha i}$

- Intuition: since the  $g^{\alpha i}$  know about “mixing” between directions normal and tangent to  $\Sigma(\lambda^i)$ , we can mix them by “tilting” the foliation  $\Sigma(\lambda^i)$  to a family of foliations  $\Sigma(s; \lambda_s^i)$ :

## Tilting Fixes $g^{\alpha i}$

- Intuition: since the  $g^{\alpha i}$  know about “mixing” between directions normal and tangent to  $\Sigma(\lambda^i)$ , we can mix them by “tilting” the foliation  $\Sigma(\lambda^i)$  to a family of foliations  $\Sigma(s; \lambda_s^i)$ :

## Tilting Fixes $g^{\alpha i}$

- Intuition: since the  $g^{\alpha i}$  know about “mixing” between directions normal and tangent to  $\Sigma(\lambda^i)$ , we can mix them by “tilting” the foliation  $\Sigma(\lambda^i)$  to a family of foliations  $\Sigma(s; \lambda_s^i)$ :

- The  $\{\lambda_s^i, x_s^\alpha\}$  give a new coordinate system (related to the  $\{\lambda^i, x^\alpha\}$  by a diffeomorphism generated by  $\eta^\alpha$ ):

$$\lambda_s^i(p) = \lambda^i(p) + s\eta^i(p) + \mathcal{O}(s^2), \quad x_s^\alpha(p) = x^\alpha(p) + s\dot{x}^\alpha(p) + \mathcal{O}(s^2)$$

# Tilting Fixes $g^{\alpha i}$

- Expanding  $g_s^{ij} \equiv g^{ab}(d\lambda_s^i)_a(d\lambda_s^j)_b$  to first order in  $s$ , get

$$\underbrace{\left. \frac{dg_s^{ij}}{ds} \right|_{s=0} - 2g^{k(i} \partial_k \eta^{j)} - \eta^k \partial_k g^{ij}}_{\text{known}} = \underbrace{\dot{x}^\alpha \partial_\alpha g^{ij} + 2g^{\alpha(i} \partial_\alpha \eta^{j)}}_{\text{linear in unknowns } \dot{x}^\alpha, g^{\alpha i}}$$

# Tilting Fixes $g^{\alpha i}$

- Expanding  $g_s^{ij} \equiv g^{ab}(d\lambda_s^i)_a(d\lambda_s^j)_b$  to first order in  $s$ , get

$$\underbrace{\left. \frac{dg_s^{ij}}{ds} \right|_{s=0} - 2g^{k(i} \partial_k \eta^{j)} - \eta^k \partial_k g^{ij}}_{\text{known}} = \underbrace{\dot{x}^\alpha \partial_\alpha g^{ij} + 2g^{\alpha(i} \partial_\alpha \eta^{j)}}_{\text{linear in unknowns } \dot{x}^\alpha, g^{\alpha i}}$$

- For  $d \geq 4$ , there are enough linear equations to determine all the unknowns, and can recover  $g^{\alpha i}$  ( $d = 3$  case studied by [Alexakis, Balehowsky, Nachman] is much harder – need to compute the deformation  $\dot{x}^\alpha$  of the isothermal coordinates)

## A Hyperbolic PDE Fixes $\phi$

- Since  $g_{\alpha\beta} = e^{2\phi}\delta_{\alpha\beta}$ , the extremality condition requires

$$K^i = 0 \quad \Rightarrow \quad \partial_\alpha f^\alpha_i + 2f^\alpha_i \partial_\alpha \phi - 2\partial_i \phi = 0 \quad (*)$$

with  $f^\alpha_i$  a known function of  $g^{ij}$ ,  $g^{\alpha i}$

## A Hyperbolic PDE Fixes $\phi$

- Since  $g_{\alpha\beta} = e^{2\phi}\delta_{\alpha\beta}$ , the extremality condition requires

$$K^i = 0 \quad \Rightarrow \quad \partial_\alpha f^\alpha_i + 2f^\alpha_i \partial_\alpha \phi - 2\partial_i \phi = 0 \quad (*)$$

with  $f^\alpha_i$  a known function of  $g^{ij}$ ,  $g^{\alpha i}$

- Construct some periodic cycle in the  $\lambda^i$ , corresponding to a “tube” swept out by the  $\Sigma(\lambda^i)$

## A Hyperbolic PDE Fixes $\phi$

- Since  $g_{\alpha\beta} = e^{2\phi}\delta_{\alpha\beta}$ , the extremality condition requires

$$K^i = 0 \quad \Rightarrow \quad \partial_\alpha f^\alpha_i + 2f^\alpha_i \partial_\alpha \phi - 2\partial_i \phi = 0 \quad (*)$$

with  $f^\alpha_i$  a known function of  $g^{ij}$ ,  $g^{\alpha i}$

- Construct some periodic cycle in the  $\lambda^i$ , corresponding to a “tube” swept out by the  $\Sigma(\lambda^i)$

## A Hyperbolic PDE Fixes $\phi$

- Since  $g_{\alpha\beta} = e^{2\phi}\delta_{\alpha\beta}$ , the extremality condition requires

$$K^i = 0 \quad \Rightarrow \quad \partial_\alpha f^\alpha_i + 2f^\alpha_i \partial_\alpha \phi - 2\partial_i \phi = 0 \quad (*)$$

with  $f^\alpha_i$  a known function of  $g^{ij}$ ,  $g^{\alpha i}$

- Construct some periodic cycle in the  $\lambda^i$ , corresponding to a “tube” swept out by the  $\Sigma(\lambda^i)$

## A Hyperbolic PDE Fixes $\phi$

- Since  $g_{\alpha\beta} = e^{2\phi}\delta_{\alpha\beta}$ , the extremality condition requires

$$K^i = 0 \quad \Rightarrow \quad \partial_\alpha f^\alpha_i + 2f^\alpha_i \partial_\alpha \phi - 2\partial_i \phi = 0 \quad (*)$$

with  $f^\alpha_i$  a known function of  $g^{ij}$ ,  $g^{\alpha i}$

- Construct some periodic cycle in the  $\lambda^i$ , corresponding to a “tube” swept out by the  $\Sigma(\lambda^i)$
- Evolve (\*) inwards from the boundary along this tube to fix  $\phi$  uniquely on every  $\Sigma(\lambda^i)$  on it

# Features

- Applies to two-dimensional extremal surfaces in an ambient spacetime of any dimension (and signature), but relevance to bulk reconstruction is in  $d = 4$ , since then HRT surfaces are two-dimensional

# Features

- Applies to two-dimensional extremal surfaces in an ambient spacetime of any dimension (and signature), but relevance to bulk reconstruction is in  $d = 4$ , since then HRT surfaces are two-dimensional
- Argument requires consistency of highly overdetermined systems of equations; this is expected on general grounds, as only the right structure of entanglement entropy can possibly correspond to a geometric dual
  - Gives (highly implicit) *necessary* conditions for the existence of a dual geometry

# Features

- Applies to two-dimensional extremal surfaces in an ambient spacetime of any dimension (and signature), but relevance to bulk reconstruction is in  $d = 4$ , since then HRT surfaces are two-dimensional
- Argument requires consistency of highly overdetermined systems of equations; this is expected on general grounds, as only the right structure of entanglement entropy can possibly correspond to a geometric dual
  - Gives (highly implicit) *necessary* conditions for the existence of a dual geometry
- Only requires knowledge of *variations* of entropy, not the actual entanglement entropy of any region

# Features

- Can probe inside black holes!

# Features

- Can probe inside black holes!

- But still stays away from singularities...

# A Reconstructive Formula

- Our result is *almost* completely constructive; it gives a much more precise connection between boundary entanglement and bulk geometry than just HRT

# A Reconstructive Formula

- Our result is *almost* completely constructive; it gives a much more precise connection between boundary entanglement and bulk geometry than just HRT
- The only non-constructive step uses the uniqueness theorem of [Albin, Guillarmou, Tzou, Uhlmann] to show that boundary data uniquely fixes  $D$  and  $Q$  in the Jacobi operator  $D^2 + Q$ ; is there a constructive analog?

# A Reconstructive Formula

- Our result is *almost* completely constructive; it gives a much more precise connection between boundary entanglement and bulk geometry than just HRT
- The only non-constructive step uses the uniqueness theorem of [Albin, Guillarmou, Tzou, Uhlmann] to show that boundary data uniquely fixes  $D$  and  $Q$  in the Jacobi operator  $D^2 + Q$ ; is there a constructive analog?
- Almost: a closely-related result gives an *explicit* method for recovering  $Q$  from the Dirichlet-to-Neumann map of the operator  $\nabla^2 + Q$  on some domain in  $\mathbb{R}^2$ , where  $\nabla^2$  is the usual (flat-space) Laplacian [Novikov, Santacesaria]
- Generalizing this to our case would give an explicit algorithm for recovering the metric from boundary entanglement

# Moving Further Up

The (semi)classical gravity we observe in our universe emerges from some more fundamental quantum theory - how?

⇓ (AdS/CFT)

In AdS/CFT, how do the CFT degrees of freedom rearrange themselves to look like a gravitational theory?

⇓ (**classical limit**)

When and how does (semi)classical gravity emerge from the boundary field theory?

⇓ (probe limit)

How are operators on a *fixed* bulk geometry recovered?

# Quantum Corrections to EE

Sub-leading effects in  $G\hbar$  ( $1/N^2$  in CFT) introduce corrections:

## Engelhardt-Wall Formula

Under perturbative quantum corrections,

$$S[R] = S_{\text{gen}}[\mathcal{X}_R] \equiv \frac{\text{Area}[\mathcal{X}_R]}{4G\hbar} + S_{\text{out}}[\mathcal{X}_R],$$

where  $\mathcal{X}_R$  is anchored to  $\partial R$  and extremizes  $S_{\text{gen}}$  (a “quantum extremal surface”), and  $S_{\text{out}}[\mathcal{X}_R]$  is the von Neumann entropy of any bulk quantum fields “outside”  $\mathcal{X}_R$  [Faulkner, Lewkowycz, Maldacena; Dong, Lewkowycz]

# Quantum Corrections to EE

Sub-leading effects in  $G\hbar$  ( $1/N^2$  in CFT) introduce corrections:

## Engelhardt-Wall Formula

Under perturbative quantum corrections,

$$S[R] = S_{\text{gen}}[\mathcal{X}_R] \equiv \frac{\text{Area}[\mathcal{X}_R]}{4G\hbar} + S_{\text{out}}[\mathcal{X}_R],$$

where  $\mathcal{X}_R$  is anchored to  $\partial R$  and extremizes  $S_{\text{gen}}$  (a “quantum extremal surface”), and  $S_{\text{out}}[\mathcal{X}_R]$  is the von Neumann entropy of any bulk quantum fields “outside”  $\mathcal{X}_R$  [Faulkner, Lewkowycz, Maldacena; Dong, Lewkowycz]

(Note:  $\mathcal{X}_R$  can reach further into the bulk than  $X_R$ , e.g. late-time horizons of evaporating black holes [Almheiri, Engelhardt, Marolf, Maxfield; Penington])

# Incorporating Quantum Effects

- In order to really start probing quantum gravity effects, should be keeping track of these corrections!
- Can consider the same sort of setup, but with foliation by classical extremal surfaces  $X_R$  replaced by quantum extremal surfaces  $\mathcal{X}_R$

# Incorporating Quantum Effects

- In order to really start probing quantum gravity effects, should be keeping track of these corrections!
- Can consider the same sort of setup, but with foliation by classical extremal surfaces  $X_R$  replaced by quantum extremal surfaces  $\mathcal{X}_R$
- Because  $S_{\text{out}}$  is not a local geometric functional, the Jacobi equation gets quantum-corrected to an integro-differential equation [Engelhardt, SF]:

$$D^2\eta^a + Q^a{}_b\eta^b + 4G\hbar \int_{\Sigma'} P^{ab} \frac{\mathcal{D}^2 S_{\text{out}}}{\mathcal{D}\Sigma^c(p')\mathcal{D}\Sigma^b} \eta^c(p') = 0,$$

with  $\mathcal{D}S_{\text{out}}/\mathcal{D}\Sigma^a$  a functional derivative

# Incorporating Quantum Effects

- In order to really start probing quantum gravity effects, should be keeping track of these corrections!
- Can consider the same sort of setup, but with foliation by classical extremal surfaces  $X_R$  replaced by quantum extremal surfaces  $\mathcal{X}_R$
- Because  $S_{\text{out}}$  is not a local geometric functional, the Jacobi equation gets quantum-corrected to an integro-differential equation [Engelhardt, SF]:

$$D^2\eta^a + \int_{\Sigma'} \tilde{Q}^a{}_b(p, p')\eta^b(p') = 0,$$

with  $\tilde{Q}^a{}_b(p, p')$  a *distributional* potential

# Incorporating Quantum Effects

- In order to really start probing quantum gravity effects, should be keeping track of these corrections!
- Can consider the same sort of setup, but with foliation by classical extremal surfaces  $X_R$  replaced by quantum extremal surfaces  $\mathcal{X}_R$
- Because  $S_{\text{out}}$  is not a local geometric functional, the Jacobi equation gets quantum-corrected to an integro-differential equation [Engelhardt, SF]:

$$D^2\eta^a + \int_{\Sigma'} \tilde{Q}^a{}_b(p, p')\eta^b(p') = 0,$$

with  $\tilde{Q}^a{}_b(p, p')$  a *distributional* potential

- Are  $D$  and  $\tilde{Q}^a{}_b$  determined by boundary data just as they are in the classical case? If so, can generalize argument

# Higher Curvature Corrections

- Turning on  $\alpha'$  corrections changes the bulk gravitational dynamics to include higher-curvature corrections

# Higher Curvature Corrections

- Turning on  $\alpha'$  corrections changes the bulk gravitational dynamics to include higher-curvature corrections
- HRT formula changes: area functional becomes another geometric functional [Dong; Camps]
- Perturbations give rise to a generalized Jacobi operator  $\tilde{\mathcal{J}}$  that depends on the perturbed area functional

# Higher Curvature Corrections

- Turning on  $\alpha'$  corrections changes the bulk gravitational dynamics to include higher-curvature corrections
- HRT formula changes: area functional becomes another geometric functional [Dong; Camps]
- Perturbations give rise to a generalized Jacobi operator  $\tilde{\mathcal{J}}$  that depends on the perturbed area functional
- If  $\tilde{\mathcal{J}}$  be recovered from boundary data, can likewise generalize the argument to recover the bulk even when it includes these higher-curvature corrections

# Summary

- Argued that for a  $4d$  classical bulk, the bulk geometry near an HRT surface is fixed by entanglement entropy of the boundary, nicely connecting bulk reconstruction in AdS/CFT and inverse boundary value problems

# Summary

- Argued that for a  $4d$  classical bulk, the bulk geometry near an HRT surface is fixed by entanglement entropy of the boundary, nicely connecting bulk reconstruction in AdS/CFT and inverse boundary value problems
- To actually start probing quantum effects, need to extend these results to (i) an *explicit* reconstruction that (ii) includes perturbative quantum corrections to the HRT formula; the framework for both exists, and this work is ongoing

# Summary

- Argued that for a  $4d$  classical bulk, the bulk geometry near an HRT surface is fixed by entanglement entropy of the boundary, nicely connecting bulk reconstruction in AdS/CFT and inverse boundary value problems
- To actually start probing quantum effects, need to extend these results to (i) an *explicit* reconstruction that (ii) includes perturbative quantum corrections to the HRT formula; the framework for both exists, and this work is ongoing
- Even geometry where HRT surfaces don't reach should be recoverable somehow; from what? Quantum extremal surfaces? Other measures of entanglement?

# Summary

- Argued that for a  $4d$  classical bulk, the bulk geometry near an HRT surface is fixed by entanglement entropy of the boundary, nicely connecting bulk reconstruction in AdS/CFT and inverse boundary value problems
- To actually start probing quantum effects, need to extend these results to (i) an *explicit* reconstruction that (ii) includes perturbative quantum corrections to the HRT formula; the framework for both exists, and this work is ongoing
- Even geometry where HRT surfaces don't reach should be recoverable somehow; from what? Quantum extremal surfaces? Other measures of entanglement?
- More generalizations:  $(d - 2)$ -dimensional surfaces in higher dimension  $d$ ; higher-curvature corrections; how generic is the assumption of a foliation?

# Fixing Conformally Flat Coordinates

- Introduce arbitrary coordinate system  $\{y^\alpha\}$  on  $\Sigma \subset \mathbb{R}^2$

# Fixing Conformally Flat Coordinates

- Introduce arbitrary coordinate system  $\{y^\alpha\}$  on  $\Sigma \subset \mathbb{R}^2$
- Extend  $g_{\alpha\beta}$  to all of  $\mathbb{R}^2$  so that  $g_{\alpha\beta} = \delta_{\alpha\beta}$  away from  $\Sigma$ , and  $g_{\alpha\beta}$  is known everywhere outside  $\Sigma$
- There exists a unique set of isothermal coordinates  $\{x^\alpha\}$  on  $\mathbb{R}^2$  such that  $x^\alpha(y) \rightarrow y^\alpha$  at large  $y^\alpha$  [Ahlfors]

# Fixing Conformally Flat Coordinates

- Introduce arbitrary coordinate system  $\{y^\alpha\}$  on  $\Sigma \subset \mathbb{R}^2$
- Extend  $g_{\alpha\beta}$  to all of  $\mathbb{R}^2$  so that  $g_{\alpha\beta} = \delta_{\alpha\beta}$  away from  $\Sigma$ , and  $g_{\alpha\beta}$  is known everywhere outside  $\Sigma$
- There exists a unique set of isothermal coordinates  $\{x^\alpha\}$  on  $\mathbb{R}^2$  such that  $x^\alpha(y) \rightarrow y^\alpha$  at large  $y^\alpha$  [Ahlfors]
- For any  $g_1, g_2$  on  $\Sigma$  with the same  $\Psi$ , the corresponding coordinates  $x_1^\alpha(y), x_2^\alpha(y)$  agree outside  $\Sigma$  and on  $\partial\Sigma$

# Fixing Conformally Flat Coordinates

- Introduce arbitrary coordinate system  $\{y^\alpha\}$  on  $\Sigma \subset \mathbb{R}^2$
- Extend  $g_{\alpha\beta}$  to all of  $\mathbb{R}^2$  so that  $g_{\alpha\beta} = \delta_{\alpha\beta}$  away from  $\Sigma$ , and  $g_{\alpha\beta}$  is known everywhere outside  $\Sigma$
- There exists a unique set of isothermal coordinates  $\{x^\alpha\}$  on  $\mathbb{R}^2$  such that  $x^\alpha(y) \rightarrow y^\alpha$  at large  $y^\alpha$  [Ahlfors]
- For any  $g_1, g_2$  on  $\Sigma$  with the same  $\Psi$ , the corresponding coordinates  $x_1^\alpha(y), x_2^\alpha(y)$  agree outside  $\Sigma$  and on  $\partial\Sigma$

So for any two metrics  $g_1, g_2$  on  $\Sigma$  with the same boundary data, there exists a set of coordinates  $\{x^\alpha\}$  on  $\Sigma$  in which both are conformally flat:

$$ds_\Sigma^2 = e^{2\phi} ((dx^1)^2 + (dx^2)^2)$$
